

Cherry angioma

The cherry angioma, also called [angioma](#) capillaire is a benign tumor that occurs mostly in people more than 40 years.

Description

The exact cause of cherry angioma is not known yet.

It is characterized by rash of points ranging from violet to red cherry on the body.

These are essentially vascular lesions consist clusters of dilated capillaries on the surface of the skin.

In its initial phase, they are the size of a pinhead and not attempt to remove out of the skin, later they usually grow up to 1/2 inch in diameter. Les The large cherry angioma bleed if punctured.

Therefore, do not squeeze or puncture.

Cherry angiomas are not related to cancer at all.

Although there has psychological effects because of their appearance, they have no medical significance.

Treatment cosmetologists

The most commonly used treatment is cryotherapy.

It involves freezing cherry angiomas, or dots red on the body at extremely low temperatures, with the help of a [liquid zote](#) .

Frozen tissues are then surgically removed.

Another common method for removing red spots on the body caused by cherry angiomas is electro-surgery or cauterization.

In electrosurgery, [electrical](#)  current is used to burn and remove the tissue.

It limits the bleeding to a certain extent
